My plugin needs to connect to a database that is part of my plugin and stores some specific data. The connection string I found in the database is not readable by WordPress, because it uses some special symbols and special characters that aren't used on Windows (it is a part of a table named wp_option, and the table content is "ALLNAMES = 'WP_AllNames'") Is there any way to parse and replace that content, or make it readable by WordPress, or even simply adding a new database table in order to store that data? A: The options table in the database is where you add custom plugin settings. In the WordPress documentation it says that you can use it as a storage for various things. Plugins are stored in plugins/default/active_plugins/ You need to get the file that contains this content and replace it with your own. In the next version of WordPress you will be able to edit it directly. Purification and properties of lipolytic enzymes from *Novosphingobium tardaugens*. *Novosphingobium tardaugens* is a Gram-negative bacterium that was isolated from the acidic soil of a tidal flat in the South of Taiwan. After incubating this bacterium on mineral salt medium (MSM) supplemented with 10 mM glucose, lipase was released into the culture supernatant. The lipase was purified by hydrophobic interaction chromatography, diethylaminoethyl (DEAE)-Sephadex A-50 ion-exchange chromatography, gel filtration and DEAE-Sepharose FF ion-exchange chromatography. The purified lipase was identified as a monomer with a molecular mass of 47 kDa, based on SDS-PAGE and gel filtration. This lipase was optimally active at pH 5.0 and 40 °C. The highest activity was observed at pH 5.0, and the highest stability of the lipase was found to be at pH 7.0 and 10 °C. The lipase showed excellent catalytic activity on various triacylglycerols (TG), triolein (TO), trioluene gly 82157476af
